

GNINA rescoring reinforces the strongest disruption hypotheses

BACE1-457 and the CHR FAM7A B-face model show the largest paired score losses and displaced selected poses. Points are seeded Vina ensembles; open circles are means with 95% t intervals.

Predicted affinity shift

Alternate minus canonical, paired within seed

CNN-selected pose displacement

Green zone marks the conventional <2 Å redocking criterion

CNNaffinity is a learned model output, not a Vina kcal/mol value. GNINA rescored fixed Vina poses; this is scoring consensus, not independent conformational sampling.
