

Crystal and docked saracatinib occupy the same FYN pocket

Proper bond topology and ray-traced molecular rendering • best seeded Vina pose shown in orange

Pose overlay

- crystal saracatinib
- best Vina pose

1.75 Å

best top-pose RMSD

What this establishes

The receptor preparation, search box, and Vina settings can recover the known canonical binding mode.

This validates pose recovery for canonical FYN; it does not measure cellular efficacy or prove disease causality.
