

Validated docking control: FYN-saracatinib

A known drug pose is recovered reproducibly; the AD-enriched alternate loses the kinase pocket.

Experimental binding pocket and recovered pose

- FYN pocket atoms
- Crystal saracatinib
- Best Vina pose

REPRODUCIBILITY

9 / 9

top poses recovered within 2 Å

MEDIAN RECOVERY

1.90 Å

fixed-frame heavy-atom RMSD

BEST RECOVERY

1.75 Å

seed 4409; exhaustive search 32

BEST VINA SCORE

-9.18

kcal/mol; scoring value, not affinity

Isoform interpretation

Novel AD-enriched transcript ends at residue 115

Conclusion: the alternate is predicted to lack the saracatinib-binding kinase domain. This is a structural hypothesis—not proof of expression, drug response, or disease causality.
